

two defective impellers almost scrubbed the mission.

48 hours before the USS Enterprise was scheduled to sail for the Persian Gulf, impellers in the ship's fresh water distillers needed replacing. PRO Services® from ITT got the call. We worked day and night to create new impellers and ensure the ship set sail on schedule. Our engineers and machinists routinely provide expert maintenance services, engineering upgrades, predictive monitoring, repairs, and of course field service for any type of rotating equipment. Whether it's helping protect our nation overseas or promoting total plant health down the street, we consider every client need as mission critical.
